Semiconductor contactor R100.xx and R300.xx Solid-state relays R111, R12x and R31x

Benefits and advantages

2CDC305 027 F0004

2CDC305 028 F0004

R100.xx and R300.xx range

- Compact design
- Zero voltage or instantaneous tripping
- LED display
- Protected against electric shock
- Integrated heat sink
- Ready for use
- Mounting on 35 mm DIN rail or screw mounting on plate

Properties

- Rated operating current range 20 A, 30 A and 45 A
- DC control
- Single-pole, three-pole
- Switching by thyristors
- Peak inverse voltage 1200 V
- Insulation voltage > 4000 V
- Connecting terminals for 2 x 2.5 mm² or 1 x 4 mm²

Special properties

- The semiconductor relay R100.45-SG is internally protected against overload with overload signaling via signaling output.
- Cables with a conductor cross section up to 1 x 25 mm² can be connected to the output terminals of the semiconductor relays R100.45 and R100.45-SG.

Application

- Contactless and wear-free switching of ohmic and inductive 1-phase and 3-phase AC loads with high switching frequency.

R111, R12x and R31x range

- Standard design
- Zero voltage tripping, radio interference suppressed
- LED display
- Screw mounting or snap-on mounting with adapter for 35 mm DIN rail according to DIN EN 50022

Properties

- R111 and R12x range - load side: Thyristors for AC-51 and AC-53 up to 690 V AC and 100 A
- R31x - load side: Alternistor for AC-51 and AC-53 up to 660 V AC and 75 A with internal RC circuit and overvoltage protection
- Electrical isolation by means of optocoupler between control circuit and load circuit
- R111 range with additional terminal cover
- Control side protected against reversed polarity

Special properties of R31x range

- Screw mounting

Application

- Contactless and wear-free switching of 1-phase and 3-phase AC loads up to a power factor of $\cos \varphi = 0.5$.

R100.xx range

- Compact design
- Zero voltage or instantaneous switching
- Rated operational voltage V_e 42-660 V AC
- Single-phase
- LED for status indication
- Current ranges: 20 A, 30 A, 45 A (thyristors)
- Integrated heat sink, ready for use
- Mounting on 35 mm DIN rail or screw mounting on plate
- Cage terminal with integrated protection against electric shock (touch proof)

Protection class	2					

Solid-state relays

Heat sink dimensioning for solid-state relays

Procedure for choosing a solid-state relay

Choosing the suitable solid-state relay is easy to do, if the following 4 questions are answered.

1. How much is the maximum operational current?
2. Which control circuit voltage is used?
3. Which operational voltage is required?
4. Is the device operated continuously or in duty cycles?

Knowing these data you can easily choose a suitable relay by means of the technical data specified in this catalog.

Procedure for choosing a suitable heat sink

After having selected the relay, a heat sink suitable for the specific application has to be chosen. For this, the following two questions are of importance.

1. How much is the maximum operational current?
2. How much is the ambient temperature during operation?

If you know the ambient temperature during operation, you can determine the thermal resistance between the bottom of the solid-state relay and the environment using a matrix as it is shown below. The respective matrixes for the other relays are shown on the following pages. Knowing the thermal resistance and the technical data of the heat sink, you can then choose a suitable heat sink.

operational current [A]	thermal resistance [K/W]						power dissipation [W]
	20	30	40	50	60	70	
50,0	1,03	0,86	0,70	0,53	0,37	0,20	61
45,0	1,27	1,09	0,90	0,71	0,52	0,33	53
40,0	1,54	1,32	1,10	0,89	0,67	0,45	46
35,0	1,85	1,59	1,34	1,08	0,82	0,57	39
30,0	2,26	1,95	1,65	1,34	1,03	0,72	33
25,0	2,85	2,47	2,08	1,70	1,32	0,94	26
20,0	3,73	3,24	2,75	2,26	1,77	1,27	20
15,0	5,22	4,54	3,86	3,19	2,51	1,83	15
10,0	8,21	7,16	6,11	5,05	4,00	2,95	10
5,0	17,2	15,0	12,9	10,7	8,51	6,33	5

T_a ambient temperature [°C]

2CDC 302 008 F0004

The selection of the heat sink directly affects the warming of the relay.

$$\text{Relay temperature } T = \text{ambient temperature} + (\text{dissipation} \cdot \text{thermal resistance})$$

The calculated value for the relay temperature should not exceed 100 °C. Otherwise, danger of fire as well as danger of damage to the device exist.

Example

Choosing the solid-state relay:

1. The maximum operational current is 30 A
2. A control circuit voltage of 230 V AC is used
3. The operational voltage is 400 V AC
4. The relay shall be used at continuous operation

→ Possible relays:

R 126/50 - R 126/75 - R 126/100

Chosen relay:

R 126/50

Choosing the heat sink:

1. The maximum operational current is 30 A
2. The ambient temperature during operation is 40 °C

The thermal resistance can be determined using the operational current-ambient temperature matrix.

The Y axis of the diagram shows the operational current, the X axis shows the ambient temperature in °C. The thermal resistance can be read at the cross-point of the operational current with the ambient temperature. In our example the thermal resistance is 1.65 K/W (kelvin/watt).

Consequently, the required heat sink must have a value of at least 1.65 K/W. Here it has to be observed that the quality of the heat sink increases with a reduction of the temperature/power ratio which means that a heat sink with a ratio of 0.5 K/W provides better heat dissipation than a heat sink with a ratio of 1.5 K/W.

The power dissipation can be read from the right column of the matrix. In our example it is 33 W.

Knowing the thermal resistance, you can now choose a suitable heat sink using the technical data.

Example 1: Heat sink KK-R111-2,1

$$T = 40 \text{ °C} + (33 \text{ W} + 2.1 \text{ K/W}) = 40 \text{ °C} + 69.3 \text{ °C} = 109.3 \text{ °C} \quad \text{Too hot!}$$

Example 2: Heat sink KK-R111-1,5

$$T = 40 \text{ °C} + (33 \text{ W} + 1.5 \text{ K/W}) = 40 \text{ °C} + 49.5 \text{ °C} = 89.5 \text{ °C} \quad \text{OK!}$$

Example 3: Heat sink KK-R111-0,5

$$T = 40 \text{ °C} + (33 \text{ W} + 0.5 \text{ K/W}) = 40 \text{ °C} + 16.5 \text{ °C} = 56.5 \text{ °C} \quad \text{OK!}$$

Due to reasons of space and costs, example 2 is the most commonly used case.

The calculated values apply for continuous duty; during cycling the heating is lower depending on the duty cycle.
